

Project Summary

This project presents a complete financial model and valuation of Trent Ltd. using Microsoft Excel. The model integrates the company's historical financial statements to project future operating performance through a fully linked three-statement model.

Forecast assumptions are based on historical trends, operating drivers, and reasonable business expectations. The projected financial statements are used to calculate Free Cash Flow to Firm (FCFF), which is discounted using the Weighted Average Cost of Capital (WACC) to estimate the company's intrinsic value through a Discounted Cash Flow (DCF) analysis.

To validate the valuation, Comparable Company Analysis has also been performed, providing a market-based benchmark against the intrinsic valuation.

Project Highlights

- Built a fully integrated three-statement financial model.
- Forecasted revenue, margins, operating expenses, working capital, capital expenditure, and depreciation.
- Estimated intrinsic value using DCF methodology.
- Performed Comparable Company Analysis.
- Included sensitivity analysis to evaluate valuation under varying assumptions.
- Applied financial modeling best practices with clear structure, linked formulas, and dynamic calculations.

Skills Applied

- Financial Modeling
- Corporate Finance
- Equity Research
- Valuation
- Financial Statement Analysis
- Forecasting
- Microsoft Excel

This project demonstrates practical proficiency in financial modeling and valuation techniques commonly used in investment banking, equity research, corporate finance, and FP&A roles.
